# STAT606 Computing for Data Science and Statistics

Lecture 15-16: Structured Data from the Web

## Lots of interesting data resides on websites

HTML : HyperText Markup Language Specifies basically everything you see on the Internet

- XML : EXtensible Markup Language Designed to be an easier way for storing data, similar framework to HTML
- **JSON** : JavaScript Object Notation Designed to be a saner version of XML
- SQL : Structured Query Language IBM-designed language for interacting with databases
- **APIs : A**pplication **P**rogramming Interface Allow interaction with website functionality (e.g., Google maps)

#### Three Aspects of Data on the Web

**Location:** URL (Uniform Resource Locator), IP address Specifies location of a computer on a network

Protocol: HTTP, HTTPS, FTP, SMTP

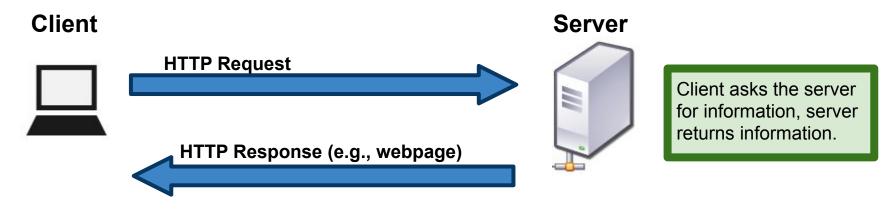

Specifies how computers on a network should communicate with one another

**Content:** HTML, JSON, XML (for example)

Contains actual information, e.g., tells browser what to display and how

We'll mostly be concerned with website content. Wikipedia has good entries on network protocols. The classic textbook is *Computer Networks* by A. S. Tanenbaum.

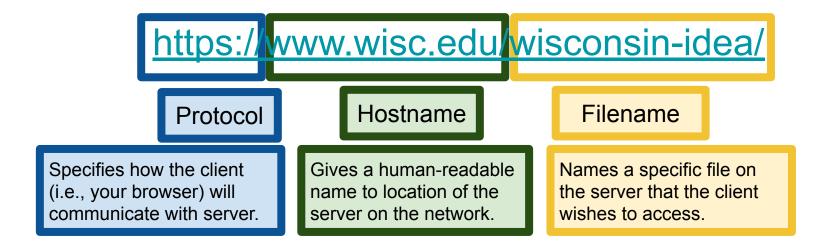

# **Client-server model**

#### HTTP is

**Connectionless:** after a request is made, the client disconnects and waits **Stateless:** server and client "forget about each other" after a request **Media agnostic:** any kind of data can be sent over HTTP

# Anatomy of a URL

**Note:** often the extension of the file will indicate what type it is (e.g., html, txt, pdf, etc), but not always. Often, one must determine the type of the file based on its contents. This can almost always be done automatically.

## Accessing websites in Python: urllib

Python library for opening URLs and interacting with websites <u>https://docs.python.org/3/howto/urllib2.html</u>

Software development community is moving towards requests https://requests.readthedocs.io/en/master/

a bit over-powered for what we want to do, but feel free to use it in HWs

**Note:** Python 3 split what was previously urllib2 in Python 2 into several related submodules of urllib. You should be aware of this in case you end up having to migrate code from Python 2 to Python 3 or vice-versa.

# Using urllib

urllib.request.urlopen() : opens the given url, returns a file-like object

# import urllib.request 2 response = urllib.request.urlopen('http://pages.stat.wisc.edu/~kdlevin') 3 response

<http.client.HTTPResponse at 0x105f82a90>

#### Three basic methods

getcode() : return the HTTP status code of the response
geturl() : return URL of the resource retrieved (e.g., see if redirected)
info() : return meta-information from the page, such as headers

#### getcode()

HTTP includes success/error status codes

**Ex:** 200 OK, 301 Moved Permanently, 404 Not Found, 503 Service Unavailable See <u>https://en.wikipedia.org/wiki/List\_of\_HTTP\_status\_codes</u>

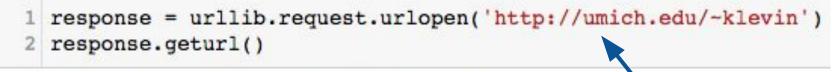

```
1 import urllib.request
2 response = urllib.request.urlopen('http://pages.stat.wisc.edu/~kdlevin')
3 response.getcode()
```

200

```
response = urllib.request.urlopen('http://pages.stat.wisc.edu/~kdlevin/nonsense.html')
```

geturl()

'http://www-personal.umich.edu/~klevin/'

Different URLs, owing to automatic redirect.

https://en.wikipedia.org/wiki/URL\_redirection

#### info()

Returns a dictionary-like object with information about the page you retrieved.

```
1 response = urllib.request.urlopen('http://pages.stat.wisc.edu/~kdlevin')
2 print(response.info())
```

```
Date: Thu, 11 Mar 2021 03:24:41 GMT
Server: Apache
Last-Modified: Sat, 30 Jan 2021 08:16:54 GMT
ETag: "659d0474-1c3b-5ba19be58e980"
Accept-Ranges: bytes
Content-Length: 7227
Connection: close
Content-Type: text/html
```

This can be useful when you aren't sure of content type or character set used by a website, though nowadays most of those things are handled automatically by parsers.

# **HTML Crash Course**

HTML is a markup language.

<tag\_name attr1="value" attr2="differentValue">String contents</tag\_name>

Basic unit: tag

(usually) a start and end tag, like contents

Contents of a tag may contain more tags:

<head><title>The Title</title></head>

This tag links to <a href="google.com">Google</a>

# HTML Crash Course

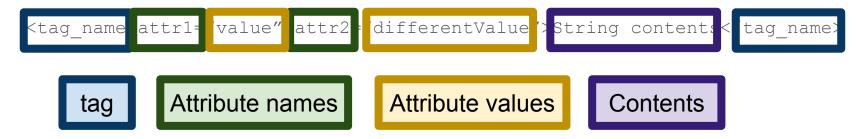

<tag\_name attr1="value" attr2="differentValue">String contents</tag\_name>

Tags have attributes, which are specified after the tag name, in (key,value) pairs of the form key="val"

#### Example: hyperlink tags

<a href="pages.stat.wisc.edu/~kdlevin">My webpage</a>
Corresponds to a link to My personal webpage.
The href attribute specifies where the hyperlink should point.

# HTML Crash Course: Recap

Of special interest in your homework: HTML tables

https://developer.mozilla.org/en-US/docs/Web/HTML/Element/table https://www.w3schools.com/html/html\_tables.asp https://www.w3.org/TR/html401/struct/tables.html

#### Okay, back to urllib

urllib reads a webpage (full of HTML) and returns a "response" object

The response object can be treated like a file:

```
import urllib.request
response = urllib.request.urlopen('https://wikipedia.org')
response.read()
```

#### Okay, back to urllib

urllib reads a webpage (full of HTML) and returns a "response" object

The response object can be treated like a file:

```
import urllib.request
response = urllib.request.urlopen('https://wikipedia.org')
response.read()
b'<1DOCTYPE html>\n<html lang="mul" class="no-js">\n<head>\n<meta charset="utf-8">\n<title>Wikipe
ame="descripti
and hosted by
ocumentElement
><meta http-equiv- imagecorbai content- no <ifendified in the pequiv- imagecorbai content- no <ifendified in the period in the pe
```

# Parsing HTML/XML in Python: beautifulsoup

Python library for working with HTML/XML data Builds nice tree representation of markup data... ...and provides tools for working with that tree

**Documentation:** <u>https://www.crummy.com/software/BeautifulSoup/bs4/doc/</u>

Good tutorial:

http://www.pythonforbeginners.com/python-on-the-web/beautifulsoup-4-python/

Installation: pip install beautifulsoup or follow instructions for conda or...

# Parsing HTML/XML in Python: beautifulsoup

BeautifulSoup turns HTML mess into a (sometimes complex) tree

Four basic kinds of objects:

Tag: corresponds to HTML tags

<[name] [attr]="xyz">[string]</[name]>) Two important attributes: tag.name, tag.string Also has dictionary-like structure for accessing attributes

NavigableString: special kind of string for use in bs4

BeautifulSoup: represents the HTML document itself

**Comment:** special kind of NavigableString for HTML comments

#### Example (from the BeautifulSoup docs)

```
1 html doc = """
  <html><head><title>The Dormouse's story</title></head>
3 <body>
  <b>The Dormouse's story</b>
5
  Once upon a time there were three little sisters; and their names were
6
7 <a href="http://example.com/elsie" class="sister" id="link1">Elsie</a>,
8 <a href="http://example.com/lacie" class="sister" id="link2">Lacie</a> and
9 <a href="http://example.com/tillie" class="sister" id="link3">Tillie</a>;
  and they lived at the bottom of a well.
10
11
12
  ...
  11 11 11
13
14 from bs4 import BeautifulSoup
15 parsed = BeautifulSoup(html doc, 'html.parser')
```

Follow along at home: https://www.crummy.com/software/BeautifulSoup/bs4/doc/#quick-start

```
1 print(parsed.prettify())
```

```
<html>
<head>
 <title>
  The Dormouse's story
 </title>
</head>
<body>
 <b>
   The Dormouse's story
  </b>
 Once upon a time there were three little sisters; and their names were
  <a class="sister" href="http://example.com/elsie" id="link1">
   Elsie
  </a>
  <a class="sister" href="http://example.com/lacie" id="link2">
   Lacie
  </a>
  and
  <a class="sister" href="http://example.com/tillie" id="link3">
   Tillie
  </a>
   ;
and they lived at the bottom of a well.
```

BeautifulSoup supports "pretty printing" of HTML documents.

# BeautifulSoup allows navigation of the HTML tags

1 parsed.title

<title>The Dormouse's story</title>

1 parsed.title.name

http://example.com/tillie

u'title'

Finds all the tags that have the 1 parsed.title.string name `a', which is the HTML u"The Dormouse's story" tag for a link. 1 parsed.find\_all('a') [<a class="sister" href="http://example.com/elsie" id="link1">Elsie</a>, <a class="sister" href="http://example.com/lacie" id="link2">Lacie</a>, <a class="sister" href="http://example.com/tillie" id="link3">Tillie</a>] The 'href' attribute in a tag for link in parsed.find\_all('a'): print link.get('href') with name 'a' contains the actual url for use in the link. http://example.com/elsie http://example.com/lacie

# A note on attributes

HTML attributes and Python attributes are different things! But in BeautifulSoup they collide in a weird way

BeautifulSoup tags have their HTML attributes accessible like a dictionary:

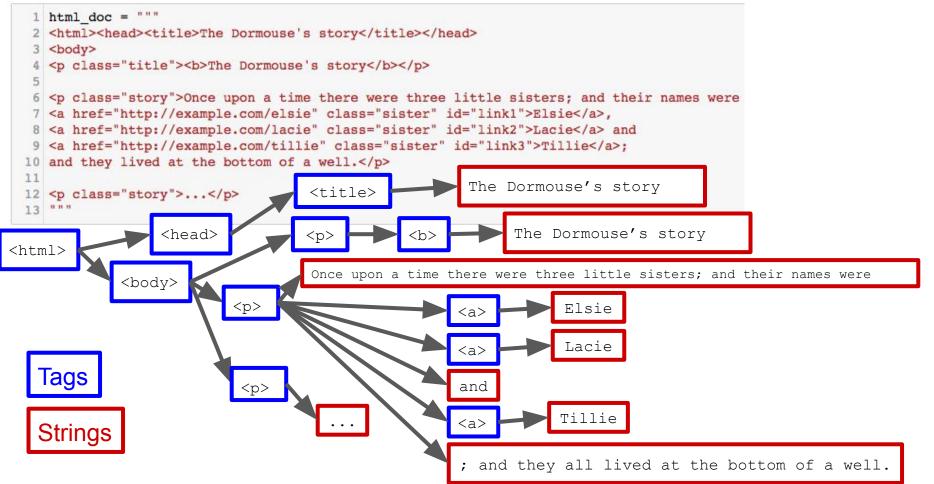

```
1 shortdoc="""
2 Once upon a time there were three little sisters; and their names were
3 <a href="http://example.com/elsie" class="sister" id="link1">Elsie</a>,
4 <a href="http://example.com/lacie" class="sister" id="link2">Lacie</a> and
5 <a href="http://example.com/tillie" class="sister" id="link3">Tillie</a>;
6 and they lived at the bottom of a well.
7 """
8 pshort = BeautifulSoup(shortdoc, 'html.parser')
9 print pshort.p['class']
```

[u'story']

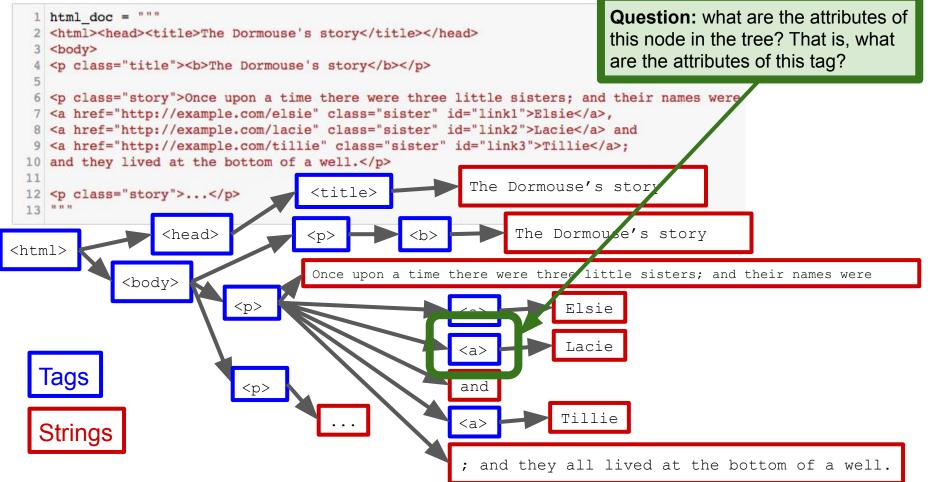

BeautifulSoup tags have their children accessible as Python attributes:

```
1 print pshort.p.a
<a class="sister" href="http://example.com/elsie" id="linkl">Elsie</a>
```

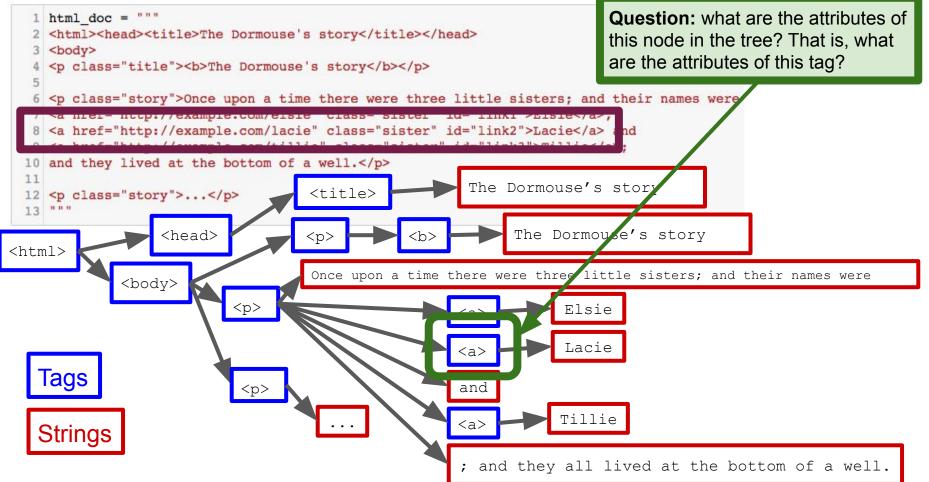

## HTML tree structure

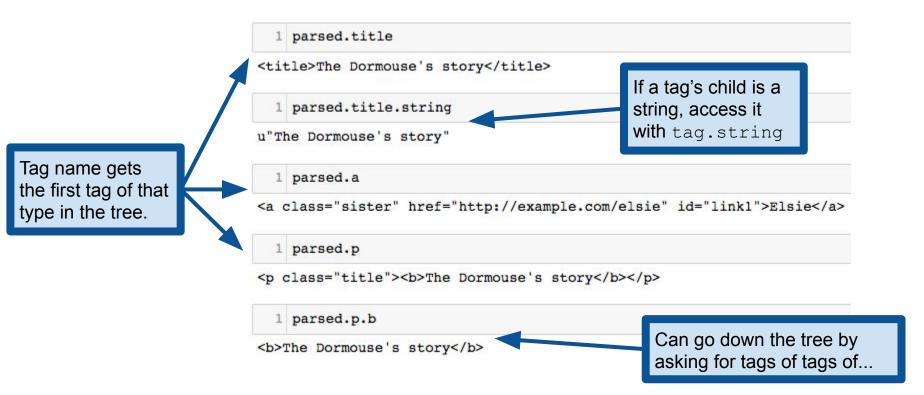

# HTML tree structure

# HTML tree structure

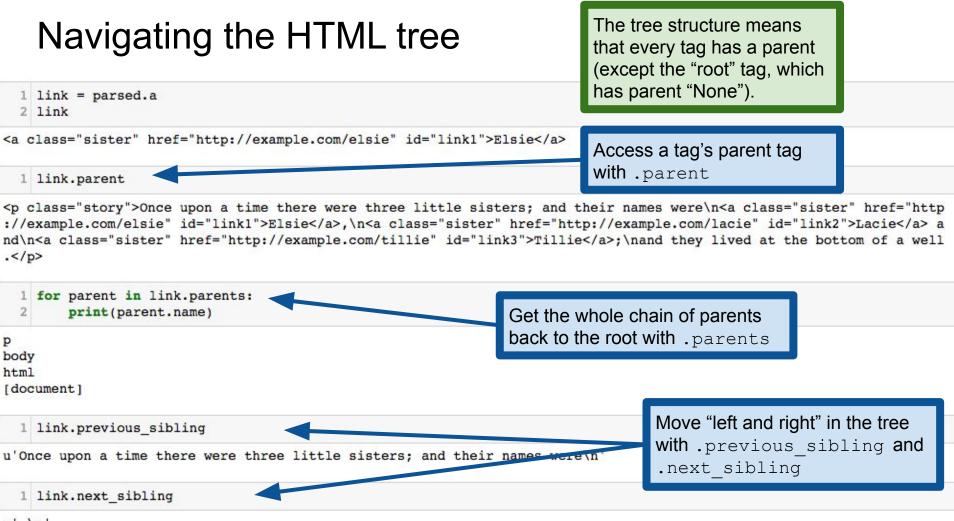

# Navigating the HTML tree

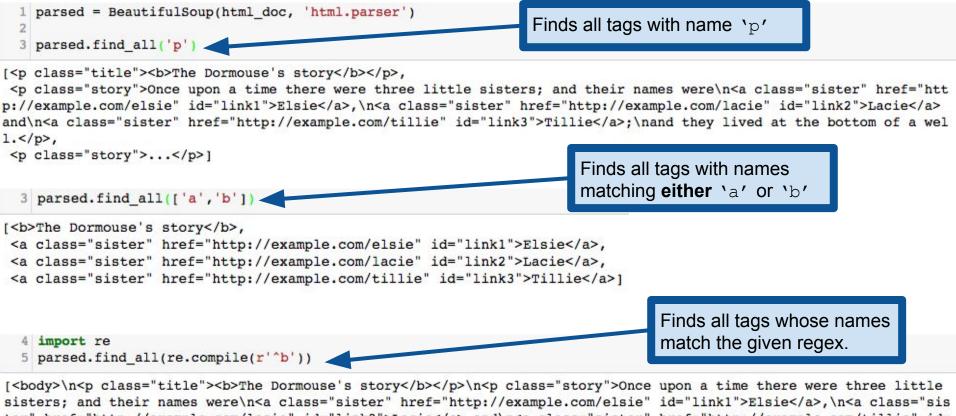

# Navigating the HTML tree

u',\n'

#### Searching the tree: find all and related methods

ter" href="http://example.com/lacie" id="link2">Lacie</a> and\n<a class="sister" href="http://example.com/tillie" id=
"link3">Tillie</a>;\nand they lived at the bottom of a well.\n...\n</body>,

<b>The Dormouse's story</b>]

#### More about find all

```
8 def has_class_but_no_id(tag):
9 return tag.has_attr('class') and not tag.has_attr('id')
10
11 parsed.find_all(has_class_but_no_id)
```

Pass in a function that returns True/False given a tag, and find\_all will return only the tags that evaluate True

[<b>The Dormouse's story</b>,

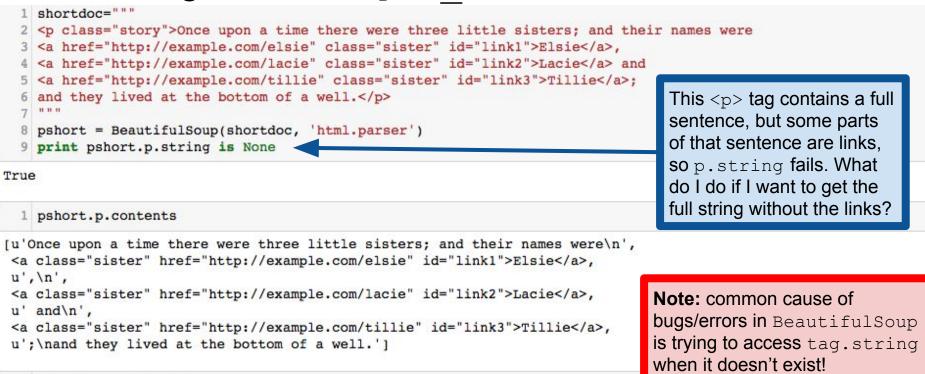

Once upon a time there were three little sisters; and their names were\n<a class="sister" href="http://example.com/elsie" id="link1">Elsie</a>,\n<a class="sister" href="http://example.com/lacie" id="link2">Lacie</a>
and\n<a class="sister" href="http://example.com/tillie" id="link3">Tillie</a>;\nand they lived at the bottom of a wel
1.,

...]

**Note:** by default, find\_all recurses down the whole tree, but you can have it only search the immediate children of the tag by passing the flag recursive=False.

See <u>https://www.crummy.com/software/BeautifulSoup/bs4/doc/#find-all</u> for more.

# Flattening contents: get text()

1 pshort.p.get\_text()

u'Once upon a time there were three little sisters; and their names were\nElsie,\nLacie and\nTillie;\nand they lived at the bottom of a well.'

# XML - eXtensible Markup Language, .xml

https://en.wikipedia.org/wiki/XML

**Core idea:** separate data from its presentation Note that HTML *doesn't* do this-- the HTML for the webpage **is** the data

But XML is tag-based, very similar to HTML

BeautifulSoup will parse XML

https://www.crummy.com/software/BeautifulSoup/bs4/doc/#installing-a-parser

We won't talk much about XML, because it's falling out of favor, replaced by...

# JSON - JavaScript Object Notation

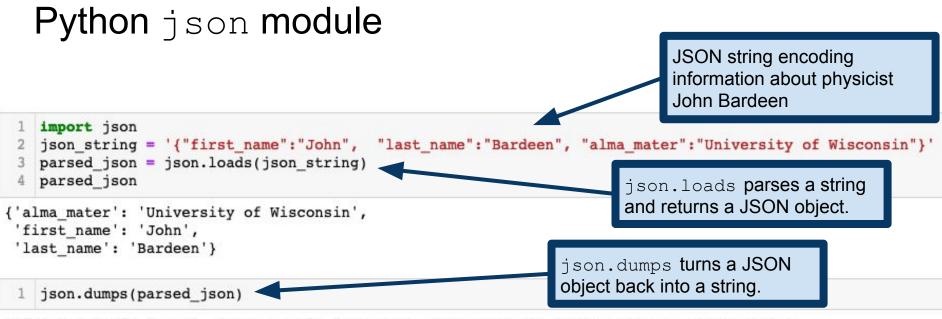

https://en.wikipedia.org/wiki/JSON

Commonly used by website APIs

Basic building blocks: attribute–value pairs array data

Example (right) from wikipedia: Possible JSON representation of a person

```
"firstName": "John",
"lastName": "Smith",
"isAlive": true,
"age": 25,
"address": {
  "streetAddress": "21 2nd Street",
  "city": "New York",
  "state": "NY",
  "postalCode": "10021-3100"
},
"phoneNumbers": [
    "type": "home",
    "number": "212 555-1234"
  },
    "type": "office",
    "number": "646 555-4567"
  },
    "type": "mobile",
    "number": "123 456-7890"
"children": [],
"spouse": null
```

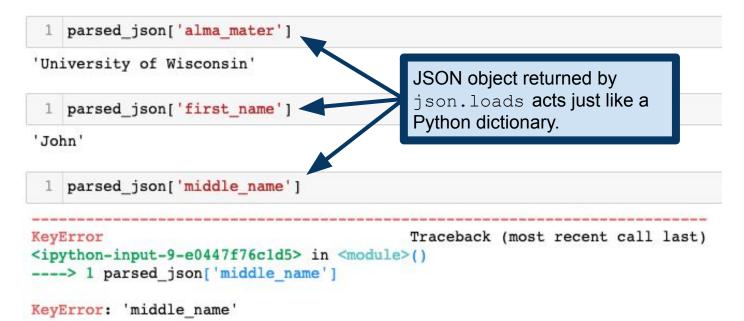

'{"first\_name": "John", "last\_name": "Bardeen", "alma\_mater": "University of Wisconsin"}'

# Python json module

1 parsed\_json

```
{'alma_mater': 'University of Wisconsin',
'first_name': 'John',
'last_name': 'Bardeen'}
```

#### JSON objects can have very complicated structure

```
complex json string="""{
       "id": "0001",
 2
       "type": "donut",
       "name": "Cake",
 5
      "ppu": 0.55,
 6
       "batters":
 7
 8
                "batter":
9
10
                        { "id": "1001", "type": "Regular" },
11
                        { "id": "1002", "type": "Chocolate" },
                        { "id": "1003", "type": "Blueberry" },
12
                        { "id": "1004", "type": "Devil's Food" }
13
14
15
           },
16
       "topping":
17
18
                { "id": "5001", "type": "None" },
19
                { "id": "5002", "type": "Glazed" },
                 "id": "5005", "type": "Sugar" },
20
               { "id": "5007", "type": "Powdered Sugar" },
21
22
               { "id": "5006", "type": "Chocolate with Sprinkles" },
                 "id": "5003", "type": "Chocolate" },
23
                { "id": "5004", "type": "Maple" }
24
25
26 }"""
```

#### JSON objects can have very complicated structure

```
complex json string="""{
       "id": "0001",
       "type": "donut",
       "name": "Cake",
       "ppu": 0.55,
 5
       "batters":
 6
 8
                "batter":
 9
10
                        { "id": "1001", "type": "Regular" },
11
                        { "id": "1002", "type": "Chocolate" },
                        { "id": "1003", "type": "Blueberry" },
12
                        { "id": "1004", "type": "Devil's Food" }
13
14
15
           ł,
16
       "topping":
17
18
                { "id": "5001", "type": "None" },
19
                 "id": "5002", "type": "Glazed" },
                  "id": "5005", "type": "Sugar" },
20
                { "id": "5007", "type": "Powdered Sugar" },
21
                { "id": "5006", "type": "Chocolate with Sprinkles" },
22
                 "id": "5003", "type": "Chocolate" },
23
                { "id": "5004", "type": "Maple" }
24
25
26 }"""
```

This can get out of hand quickly, if you're trying to work with large collections of data. For an application like that, you are better off using a database, about which we'll learn in our next lecture.
