Working group meeting presentation

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

### Overview of the slides

- Priors on density space
- Notions of neighborhood and distances
- Consistent tests
- Weak and strong posterior consistency main conditions & applications

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Notion of rates of posterior convergence
- Main conditions
- Examples

- NP Bayes priors on infinite dimensional space (density, regression function, conditional density etc)
- Examples Dirichlet process, Gaussian process, Levy process etc
- Today posterior consistency & rates in density estimation
- X complete separable metric space (ℜ for our discussion), B
   Borel σ-field on X

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- ➤ F space of densities on (X, B) w.r.t. some dominating measure
- ►  $Y_1, \ldots, Y_n \stackrel{\text{i.i.d.}}{\sim} f \in \mathcal{F}, f \sim \Pi$

The posterior distribution is the random measure

$$\Pi(B \mid y^n) = \frac{\int_B \prod_{i=1}^n f(y_i) d\Pi(f)}{\int_{\mathcal{F}} \prod_{i=1}^n f(y_i) d\Pi(f)}$$

where B is a m'ble subset of  $\mathcal{F}$  and  $y^n = (y_1, \ldots, y_n)$ 

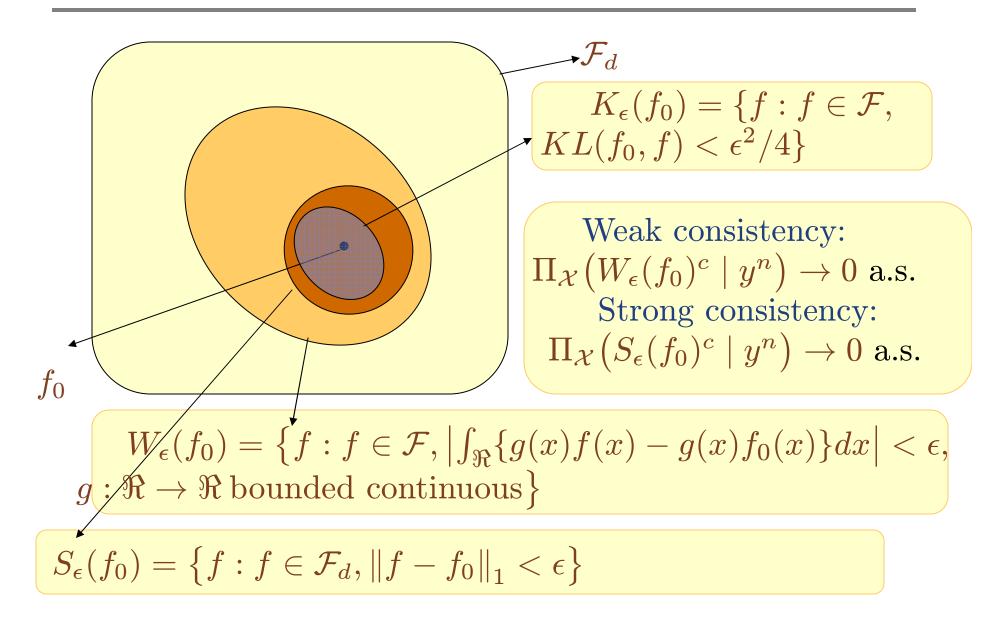

- Assume data sampled i.i.d. from  $f_0 \in \mathcal{F}$
- ▶ Qn: does the posterior concentrate on arbitrary small neighborhoods of  $f_0$  as  $n \to \infty$ ? If so, at what rate? For which neighborhoods?
- First, need notions of distances and neighborhoods on density spaces

#### Distances & nbds on density space

- ▶ Weak convergence  $f_n \rightarrow f$  weakly if for any bounded continuous function  $\phi$ ,  $\int \phi f_n \rightarrow \int \phi f$
- A weak nbd  $W_{\epsilon}(f_0) = \{f \in \mathcal{F} : |\int \phi f \int \phi f_0| < \epsilon\}$
- Strong or  $L_1$  convergence  $f_n \to f$  in  $L_1$  if  $\int |f_n f| \to 0$
- ► A strong nbd  $S_{\epsilon}(f_0) = \{f \in \mathcal{F} : \int |f f_0| = ||f f_0||_1 < \epsilon\}$
- Also,  $KL(f_0, f) = \int f_0 \log(f_0/f), \ h^2(f, f_0) = \int (\sqrt{f} \sqrt{f_0})^2$
- ► A KL nbd  $KL_{\epsilon}(f_0) = \{f \in \mathcal{F} : KL(f_0, f) < \epsilon\}$
- Entropy of *F*<sub>0</sub> ⊂ *F* := log *N*(*ε*, *F*<sub>0</sub>, || · ||<sub>1</sub>) is log min. number of balls of radius *ε* in the metric *d* required to cover *F*<sub>0</sub>.

 Interplay among these distances crucial, list of common inequalities in appendix

### Weak / strong neighborhood / consistency

- Basic idea: posterior probability of an arbitrary nbd around f<sub>0</sub> goes to 1 as n → ∞
- Weak consistency:  $\Pi(W_{\epsilon}(f_0) \mid y^n) \rightarrow 1$  a.s.  $f_0$
- Strong consistency:  $\Pi(S_{\epsilon}(f_0) \mid y^n) \rightarrow 1$  a.s.  $f_0$
- Early result by Doob (1948): posterior consistent a.e. on prior support, not useful to check consistency at a particular density

Breakthrough result by Schwartz (1965)

- Let  $f_0 \in \mathcal{F}$  and U be some nbd of  $f_0$
- Intuitively, should be able to separate f<sub>0</sub> from U<sup>c</sup> formalized through consistent tests
- ► A test function φ<sub>n</sub>(y<sup>n</sup>) is a non-negative measurable function bounded by 1
- Suppose testing  $H_0: f = f_0$  vs  $H_1: f \in U^c$
- φ<sub>n</sub>(y<sup>n</sup>) can be thought of as a randomized decision rule so
   that φ<sub>n</sub>(y<sup>n</sup>) = I(Rejection region|y<sup>n</sup>)
- A sequence of test functions said to be uniformly consistent if both probabilities of type I and II errors converge to 0 as n increases

### Exponentially consistent & unbiased tests

{φ<sub>n</sub>(y<sup>n</sup>)} is uniformly exponentially consistent if there exist constants C, β > 0 such that

$$\mathsf{E}_{f_0}[\phi_n(y^n)] \le C \exp\left(-n\beta\right)$$
  
$$\sup_{f \in U^c} [1 - \phi_n(y^n)] \le C \exp\left(-n\beta\right)$$

•  $\{\phi_n(y^n)\}$  is strictly unbiased if

$$\mathsf{E}_{f_0}[\phi_n(y^n)] < \inf_{f \in U^c}[\phi_n(y^n)]$$

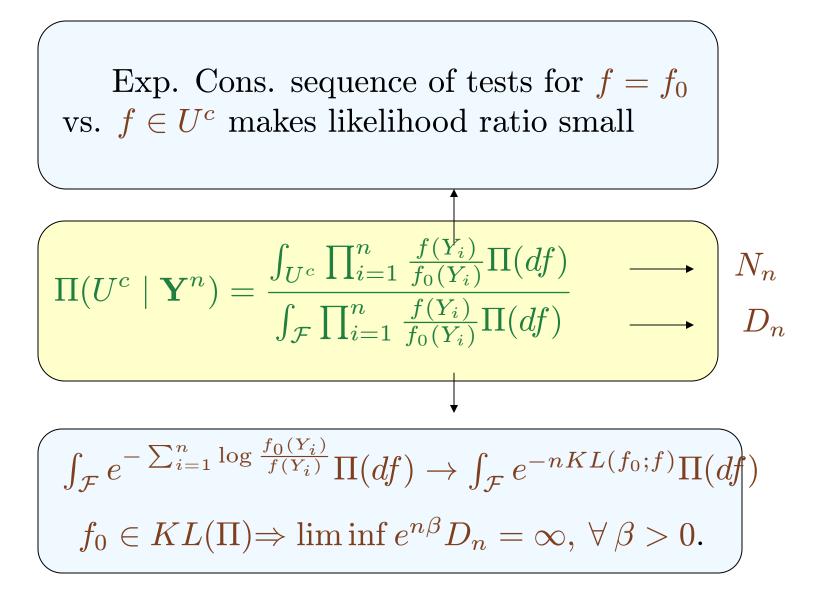

The two notions above are equivalent (Hoeffding's inequality)
 Unbiased tests often easier to construct

#### Theorem

Let  $\Pi$  be a prior on  $\mathcal{F}$  and  $f_0 \in \mathsf{KL}(\Pi)$ . If there exist a sequence of exponentially consistent tests for  $H_0 : f = f_0$  vs  $H_1 : f \in U^c$ , then  $\Pi(U \mid y^n) \to 1$  a.s.  $P_{f_0}^{\infty}$ 

- ▶ Note  $f_0 \in \mathsf{KL}(\Pi)$  means for any  $\epsilon > 0$ ,  $\Pi(\mathsf{KL}_{\epsilon}(f_0)) > 0$
- Loosely speaking, Schwartz's theorem states large KL support
   + model identifiability condition ⇒ posterior consistency

► The KL distance related to likelihood ratios, since  $(1/n)\sum_{i=1}^{n} \log\{f_0(Y_i)/f(Y_i)\} \rightarrow KL(f_0, f)$  by SLLN

### Specialized conditions for weak and strong consistency

- Turns out that the exponentially consistent test criterion is difficult to verify
- Need easy to verifiable conditions specific to neighborhoods

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Theorem: weak If  $f_0 \in KL(\Pi)$ , the posterior is weakly consistent at  $f_0$ .

### Specialized conditions for weak and strong consistency

- Turns out that the exponentially consistent test criterion is difficult to verify
- Need easy to verifiable conditions specific to neighborhoods

Theorem: weak If  $f_0 \in KL(\Pi)$ , the posterior is weakly consistent at  $f_0$ .

Theorem: strong (Ghosal et al. 1999) If  $f_0 \in \mathsf{KL}(\Pi)$  and there exists a sequence of subsets  $\mathcal{F}_n \subset \mathcal{F}$  such that for any  $\epsilon > 0$ 

- 1.  $\log N(\epsilon, \mathcal{F}_n, || \cdot ||_1) \approx o(n)$
- 2.  $\Pi(\mathcal{F}_n^c) \leq e^{-cn}$

then the posterior is  $L_1$ -consistent at  $f_0$ .

Weak consistency: If  $U_{\phi}$  is a weak neighborhood of  $f_0$ , for a bounded conts. function  $\phi$ 

$$\left(U_{\phi} = \left\{f : \left|\int \phi f - \int \phi f_{0}\right| < \epsilon\right\}\right)$$

Choose the test function to be  $\phi$  since Type I error:  $E_{f_0} \{\phi(Y_1)\} = \int \phi f_0$  and Power:  $\inf_{f \in U_{\phi}^c} \int \phi f \ge \int \phi f_0 + \epsilon$   $\Rightarrow$  existence of unbiased sequence of tests **KL condition suffices for weak consistency** 

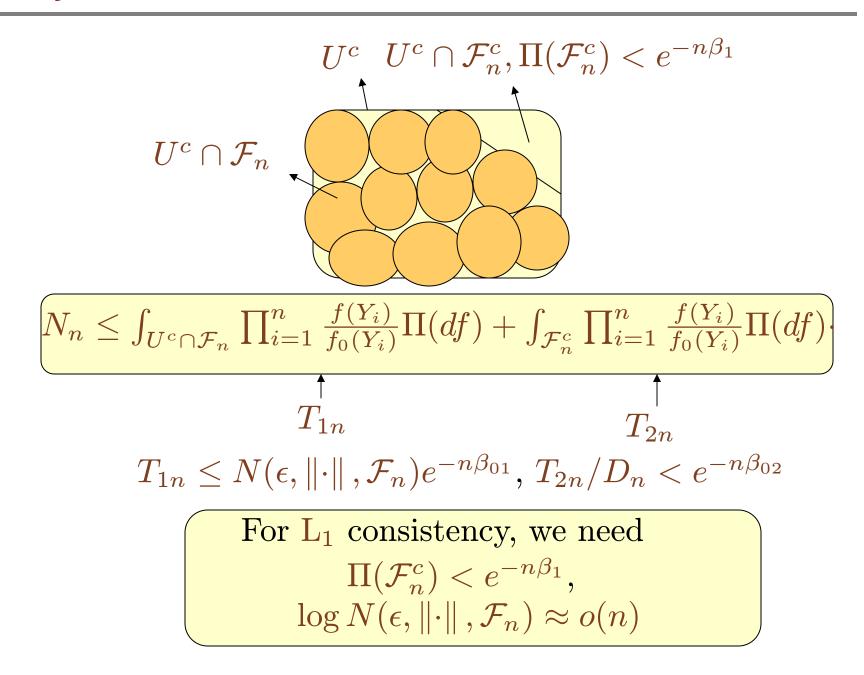

### Strong consistency – Why Ghosal et al. 1999 works?

Strong consistency: If U is a strong nhbd. of  $f_0$  i.e.  $U = \{f : ||f - f_0||_1 < \epsilon\}$ Trivial to construct exponential consistent tests for  $H_0 : f = f_0 \& H_1 : f \in C$   $f_0 \bullet \bullet f_1$ 

How do we do it?

 $C = \{f : \|f - f_1\|_1 \le \|f_1 - f_0\|_1 / 2\}$ Take  $B = \{y : f_1(y) > f_0(y)\}$  and  $\Phi = I_B$ Then  $E_{f_1}(\Phi) \ge E_{f_0}(\Phi) + \|f_1 - f_0\|_1 / 2$ 

### Why Ghosal et al 1999 works?

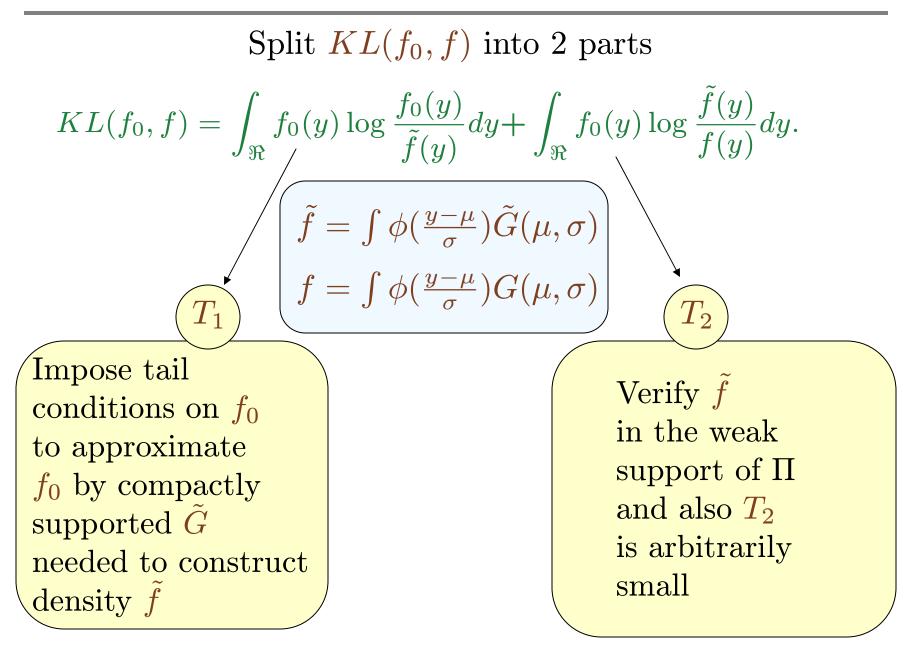

#### Example: Density estimation using DPM

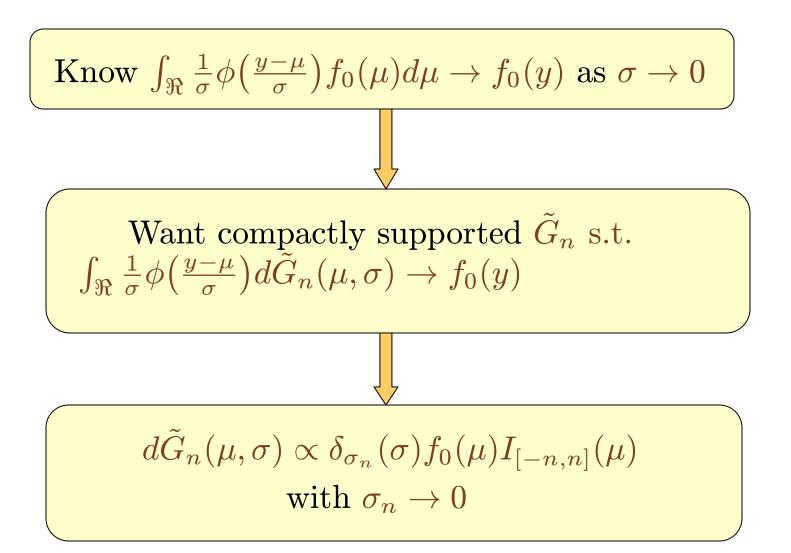

- ▶  $Y_1, Y_2, \ldots, \sim f_0 \in \mathcal{F}$ , want to estimate  $f_0$
- We specify Π by Y<sub>i</sub> ~ N(μ<sub>i</sub>, σ<sup>2</sup><sub>i</sub>), (μ<sub>i</sub>, σ<sup>2</sup><sub>i</sub>) | P ~ P, P ~ DP(αG<sub>0</sub>), G<sub>0</sub> a distribution on ℜ × ℜ<sup>+</sup>, π<sub>h</sub> are constructed by stick-breaking Beta(1, α) variates.
- Induced density of  $Y_i, f(y_i) = \sum_{h=1}^{\infty} \pi_h N(y_i, \mu_h, \sigma_h^2), (\mu_h, \sigma_h)^2 \sim G_0$
- ▶ Under what conditions on *f*<sub>0</sub> and *G*<sub>0</sub> do we have weak and strong posterior consistency?

(日) (同) (三) (三) (三) (○) (○)

### Weak cons. in DPM (Ghosal et al. 1999; Tokdar 2006)

## Constructing $\tilde{f}$ : approximation idea

## Handling $T_1$

 $\begin{array}{l} \text{A1. } f_0 \text{ is nowhere zero, continuous and bounded by } M < \infty. \\ \text{A2. } |\int_{\Re} f_0(y) \log f_0(y) dy| < \infty. \\ \text{A3. } |\int_{\Re} f_0(y) \log \frac{f_0(y)}{\psi(y)} dy| < \infty, \\ \text{ where } \psi(y) = \inf_{t \in [y-1,y+1]} f_0(t). \\ \text{A4. } \exists \ \eta > 0 \text{ such that } \int_{\mathcal{Y}} |y|^{2(1+\eta)} f_0(y) dy < \infty. \end{array}$ 

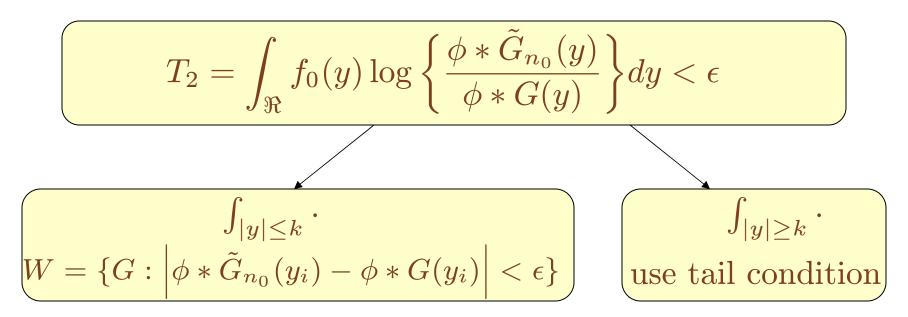

Under (A1)-(A4), using a compactly supported sequence  $\tilde{G}_n$ ,

$$f_n(y) = \int \frac{1}{\sigma} \phi\left(\frac{y-\mu}{\sigma}\right) d\tilde{G}_n(\mu,\sigma)$$

approximates  $f_0(y)$  and makes  $T_1$  arbitrarily small as  $n \to \infty$ . Choose  $\tilde{f} = f_{n_0}$  for large enough  $n_0$ .

# Handling $T_2$

Find a weak nhbd W of  $\tilde{G}_{n_0}$  such that for  $G \in W$ ,  $T_2$  is small.

What are the pieces left ?Need to ensure that a DP assigns some mass at WTRUE if  $G_0$  has full support

# Strong consistency in DPM (Sieve construction)

How do we construct a sieve  $\mathcal{F}_n$  such that 1.  $\log N(\mathcal{F}_n, \|\cdot\|, \epsilon) = o(n)$ 2.  $\Pi(\mathcal{F}_n^c) = O(e^{-n})$ 

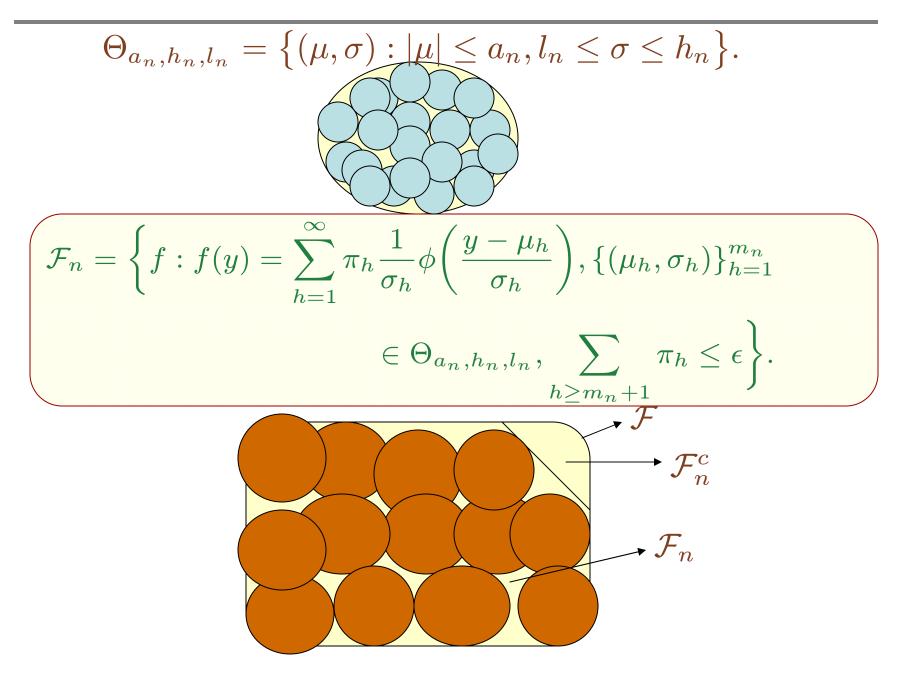

Ghosal et al. 1999 restrictive in terms of applicability An alternative (Pati, Dunson & Tokdar, 2011)

 $\mathcal{F}_n$  resembles finite mixtures  $\sum_{h=1}^{m_n} \pi_h \frac{1}{\sigma_h} \phi\left(\frac{y-\mu_h}{\sigma_h}\right)$ 

1. First few atoms are in a compact set

2. Tail sum is small

## Strong consistency in DPM (Sieve construction)

## **Sieve construction (Contd.)**

For 
$$f_1, f_2 \in \mathcal{F}_n, \|f_1 - f_2\|_1 \leq \int_{\mathcal{X}} \sum_{h=1}^{m_n} \pi_h^{(1)} \left| \phi_{\mu_h^{(1)}, \sigma_h^{(1)}}(y) - \phi_{\mu_h^{(2)}, \sigma_h^{(2)}}(y) \right| dy + \sum_{h=1}^{m_n} \left| \pi_h^{(1)} - \pi_h^{(2)} \right| + 2\epsilon.$$

**#** balls needed=  $N(\Theta_{a_n,h_n,l_n},\epsilon, \|\cdot\|) \le d_1\left(\frac{a_n}{l_n}\right) + d_2\log\frac{h_n}{l_n} + 1.$ 

# balls needed=
$$N(\mathcal{F}_n, 4\epsilon, \|\cdot\|_1) \leq \left\{ d_1\left(\frac{a_n}{l_n}\right) + d_2\log\frac{h_n}{l_n} + 1 \right\}^{m_n} m_n^{m_n}$$

### Strong consistency (Choice of $m_n, a_n, l_n, h_n$ )

1. If 
$$G_0 = N_p(\mu; \mu_0, \Sigma_0) \times IG(\sigma^2; a, b)$$
, then  
 $a_n = O(\sqrt{n}), l_n = O(\frac{1}{\sqrt{n}}), h_n = e^n$ .

- 2.  $P(\sum_{h=m_n+1}^{\infty} \pi_h > \epsilon) \le e^{-m_n \log m_n}, \ m_n = O\left(\frac{n}{\log n}\right)$
- 3. With these choices of  $m_n, a_n, l_n, h_n$ , given any  $\xi > 0$ ,

 $\log(N(\mathcal{F}_n, 4\epsilon, \|\cdot\|_1)) = o(n),$ 

4.  $\Pi(\mathcal{F}_n^c) \le O(e^{-n})$ 

- Once we have consistency, natural to ask whether we can characterize how fast the posterior concentrates
- In posterior consistency, we consider a fixed ball of radius e around f<sub>0</sub>
- Let the ball around f<sub>0</sub> shrink with n as fast as possible so that it still captures most of the posterior mass

Ghosal, Ghosh & van der Vaart (2000) Suppose that for a sequence  $\epsilon_n \to 0$  with  $n\epsilon_n^2 \to \infty$ , a constant C > 0 and sets  $\mathcal{F}_n \subset \mathcal{F}$ , one has

$$\begin{split} &\log N(\epsilon_n, \mathcal{F}_n, d) \leq C_1 n \epsilon_n^2 \\ &\Pi(\mathcal{F}_n^c) \leq C_3 \exp\{-n \epsilon_n^2 (C_2 + 4)\} \\ &\Pi\left(f_{\mu, \sigma} : \int f_0 \log \frac{f_0}{f_{\mu, \sigma}} \leq \epsilon_n^2, \int f_0 \log \left(\frac{f_0}{f_{\mu, \sigma}}\right)^2 \leq \epsilon_n^2\right) \geq C_4 \exp\{-C_2 n \epsilon_n^2\}. \end{split}$$

Then, for sufficiently large M,  $E\{\Pi(f: d(f, f_0) \ge M\epsilon_n \mid y^n\} \to 0$ 

- A more subtle interplay, roughly requires prior to be uniformly spread over the parameter space
- d usually Hellinger or L<sub>1</sub> metric

### Application to a specific problem

Density estimation model (Kundu & Dunson, 2011)

$$y_i = \mu(\eta_i) + \epsilon_i, \ \eta_i \sim U(0, 1),$$
  
$$\epsilon_i \sim N(0, \sigma^2), \ (i = 1, \dots, n).$$

▶  $f_0$  true density,  $F_0$  c.d.f. with  $\mu_0 = F_0^{-1} : (0,1) \rightarrow \Re$ , induced density  $f_{\mu_0,\sigma}(y) =$ 

$$\int_{0}^{1} \phi_{\sigma}(y - F_{0}^{-1}(t)) dt = \int_{a_{0}}^{b_{0}} \phi_{\sigma}(y - z) f_{0}(z) dz$$

- ►  $f_{\mu_0,\sigma}(y) = \phi_{\sigma} * f_0(y)$ , smoothness assumptions on  $f_0$  imply  $d(f_0, f_{\mu_0,\sigma}) \to 0$  as  $\sigma \to 0$
- ▶  $f_0$  compactly supported implies  $\mu_0 : [0,1] \rightarrow [a_0, b_0]$
- ►  $f_0$  supported on  $\Re$  implies  $|\mu_0(t)| \to \infty$  as  $t \to 0/1$

### Prior specification

- Prior for (μ, σ) ∈ C([0,1]) ⊗ (0,∞) induces a prior on the space of densities on (ℜ, B)
- Intuition: Π<sub>μ</sub> concentrating around μ<sub>0</sub> and Π<sub>σ</sub> around zero would imply f<sub>μ,σ</sub> places +ve probability to arbitrary nbds of f<sub>0</sub>
- Induced measure ν<sub>μ</sub>(B) = λ̃(μ<sup>-1</sup>(B)), μ : ([0,1], λ̃) → (ℜ, B) m'ble, λ̃ Leb. meas. on [0,1]
- Marginalizing out  $\eta_i$ , induced density  $f_{\mu,\sigma}$ ,

$$f_{\mu,\sigma}(y) = \int_0^1 \phi_\sigma(y-\mu(t)) dt = \int \phi_\sigma(y-z) 
u_\mu(dz)$$

#### Review of Gaussian processes

- Want mechanism to produce random (continuous) functions.
- A random vector X : (Ω, E, P) → ℜ<sup>k</sup> is Gaussian if a<sup>T</sup>X is Gaussian for any a ∈ ℜ<sup>k</sup>
- ▶ Let  $X : (\Omega, \mathcal{E}, P) \rightarrow (\mathcal{C}[0, 1], || \cdot ||_{\infty})$  be measurable
- X is called <u>Gaussian</u> if L(X) is Gaussian for any linear functional L
- ► For example, L(f) = f(1/2), L(f) = 2f(1/3) f(3/4), ...
- Clearly, for any  $(t_1, \ldots, t_m)$ ,  $\sum_{i=1}^m a_i X(t_i)$  is Gaussian for any  $a \in \Re^m$

•  $(X_{t_1}, \ldots, X_{t_m})$  is MVN

- Specify a joint Gaussian for  $(X_{t_1}, \ldots, X_{t_m})$  consistently
- Let C(t, s) be a positive definite covariance kernel, i.e.,  $\mathbf{C} = (C(t_i, t_j))$  is positive definite for any  $t_1, \ldots, t_m$
- $(X_{t_1},\ldots,X_{t_m}) \sim N(0,\mathbf{C})$ , so that  $C(s,t) = \operatorname{cov}(X_s,X_t)$
- Common examples:  $C(t,s) = \min(t,s)$ ,  $C(t,s) = \exp(-\kappa |t-s|)$ ,  $C(t,s) = \exp(-\kappa |t-s|^2)$  etc

### Series expansion approach

Mercer's theorem: There exists a sequence of eigenvalues λ<sub>h</sub> ↓ 0 and an orthonormal system of eigenfunctions φ<sub>h</sub>, such that

$$C(s,t) = \sum_{h=1}^{\infty} \lambda_h \phi_h(s) \phi_h(t)$$

- Define  $\tilde{X}(t) = \sum_{h=1}^{\infty} \lambda_h^{1/2} Z_h \phi_h(t)$ , where  $Z_h$  i.i.d. N(0,1)
- $\blacktriangleright \operatorname{cov}(\tilde{X}_s, \tilde{X}_t) = \sum_{h=1}^{\infty} \lambda_h \phi_h(s) \phi_h(t) = C(s, t)$
- We can start with a series representation by choosing λ<sub>h</sub> and φ<sub>h</sub>. Different choices lead to splines, neural networks, wavelets, etc

### RKHS of Gaussian processes

- In np Bayes, want priors to place positive probability around arbitrary neighborhoods of a large class of parameter values (large support property)
- The prior concentration plays a key role in determining the rate of posterior contraction
- The reproducing kernel Hilbert space (RKHS) of a Gaussian process determines the prior support and concentration
- Let X be a zero mean Gaussian process on [0, 1] with covariance kernel C(s, t) = E(X<sub>s</sub>X<sub>t</sub>)
- ▶ The RKHS II is the completion of the linear space

$$f(t)=\sum_{h=1}^m a_h C(s_h,t), \, s_h\in [0,1], \, a_h\in \Re.$$

 Intuitively, a space of functions that are similar to the covariance kernel in terms of smoothness

#### Properties

- ▶ If  $f_1(t) = C(s_1, t), f_2(t) = C(s_2, t)$ , define  $(f_1, f_2)_{\mathbb{H}} = C(s_1, s_2)$ . Extend linearly and continuously to whole of  $\mathbb{H}$
- ► Finite-dimensional case: let  $X \sim N_k(0, \Sigma)$ ,  $\Sigma$  pd. Then  $\mathbb{H} = \Re^k$ ,  $(x, y)_{\mathbb{H}} = x^T \Sigma^{-1} y$  and hence  $||x||_{\mathbb{H}}^2 = x^T \Sigma^{-1} x$ . Same RKHS norm on density contours!!
- The support of a mean zero Gaussian process is the closure of the RKHS. For many standard covariance kernels, the support equals C[0, 1]
- The rate of posterior contraction at a function  $f_0$  depends on

$$\phi_{f_0}(\epsilon) = \inf_{h \in \mathbb{H}: ||h - f_0||_{\mathbb{H}} < \epsilon} ||h||_{\mathbb{H}}^2 - \log \Pr(||X||_{\infty} < \epsilon)$$

- Ongoing work (Pati, Bhattacharya & Dunson, 2011) on posterior convergence rates in NL-LVM model
- Only focus on the compactly supported case here
- Analysis of non-compact case more involved as quantile function of a non-compact density not in C[0, 1]
- Standard sieve available for GP priors (van der Vaart & van Zanten 2007 onwards) - clever application of Borel's inequality

KL condition main hurdle

### Details

- Assume  $f_0$  twice continuously differentiable, optimal minimax rate in that case  $n^{-2/5}$
- Using a GP prior with squared exponential covariance kernel for  $\mu$  & an inverse-gamma prior for  $\sigma$ , we achieve the minimax rate up to a log-factor
- One has

$$\int f_0 \log\left(\frac{f_0}{f_{\mu,\sigma}}\right)^2 \leq h^2(f_0,f_{\mu,\sigma}) \bigg(1+\log||\frac{f_0}{f_{\mu,\sigma}}||_\infty\bigg)^2$$

• With  $\epsilon_n = n^{-2/5} (\log n)^{\kappa}$  and  $\sigma_n^4 = \epsilon_n^2$ ,

$$\{\sigma \in [\sigma_n, \sigma_n + \sigma_n^b], ||\mu - \mu_0||_{\infty} \precsim O(\sigma_n^3)\} \subset \left\{ \int f_0 \log \frac{f_0}{f_{\mu,\sigma}} \precsim \sigma_n^4, \int f_0 \log \left(\frac{f_0}{f_{\mu,\sigma}}\right)^2 \precsim \sigma_n^4 \right\}.$$

▶ 
$$||p - q||_1^2 \le 4h^2(p,q) \le 4||p - q||_1$$
  
▶  $\mathsf{KL}(p,q) \ge ||p - q||_1^2/2$   
▶  $\mathsf{KL}(p,q) \le h^2(p,q)\{1 + \log ||p/q||_\infty\}$   
▶  $p = \mathsf{N}(\mu_1, \sigma_1^2), q = \mathsf{N}(\mu_2, \sigma_2^2) \text{ with } \sigma_2 > \sigma_1 > \sigma_2/2, \text{ then } ||p - q||_1 \le (2/\pi)^{0.5} |\mu_1 - \mu_2|/\sigma_2 + 3(\sigma_2 - \sigma_1)/\sigma_1$
