Multiple Traits & Microarrays

1. why study multiple traits together? 2-10
 - diabetes case study
2. design issues 11-13
 - selective phenotyping
3. why are traits correlated? 14-17
 - close linkage or pleiotropy?
4. modern high throughput 18-31
 - principal components & discriminant analysis
5. graphical models 32-36
 - building causal biochemical networks

fri 14 jul 2006

2

1. why study multiple traits together?

- avoid reductionist approach to biology
 - address physiological/biochemical mechanisms
 - Schmalhausen (1942); Falconer (1952)
- separate close linkage from pleiotropy
 - 1 locus or 2 linked loci?
- identify epistatic interaction or canalization
 - influence of genetic background
- establish QTL x environment interactions
- decompose genetic correlation among traits
- increase power to detect QTL

Type 2 Diabetes Mellitus

from Unger & Orci *FASEB J.* (2001) 15,312

studying diabetes in an F2

- segregating cross of inbred lines
 - B6.ob x BTBR.ob \rightarrow F1 \rightarrow F2
 - selected mice with ob/ob alleles at leptin gene (chr 6)
 - measured and mapped body weight, insulin, glucose at various ages (Stoehr et al. 2000 *Diabetes*)
 - sacrificed at 14 weeks, tissues preserved
- gene expression data
 - Affymetrix microarrays on parental strains, F1
 - (Nadler et al. 2000 *PNAS*; Ntambi et al. 2002 *PNAS*)
 - RT-PCR for a few mRNA on 108 F2 mice liver tissues
 - (Lan et al. 2003 *Diabetes*; Lan et al. 2003 *Genetics*)
 - Affymetrix microarrays on 60 F2 mice liver tissues
 - design (Jin et al. 2004 *Genetics* tent. accept)
 - analysis (work in prep.)

8

why map gene expression as a quantitative trait?

- *cis*- or *trans*-action?
 - does gene control its own expression?
 - or is it influenced by one or more other genomic regions?
 - evidence for both modes (Brem et al. 2002 Science)
- simultaneously measure all mRNA in a tissue
 - ~5,000 mRNA active per cell on average
 - ~30,000 genes in genome
 - use genetic recombination as natural experiment
- mechanics of gene expression mapping
 - measure gene expression in intercross (F2) population
 - map expression as quantitative trait (QTL)
 - adjust for multiple testing

20

mapping microarray data

- single gene expression as trait (single QTL)
 - Dumas et al. (2000 *J Hypertens*)
- overview, wish lists
 - Jansen, Nap (2001 *Trends Gen*); Cheung, Spielman (2002); Doerge (2002 *Nat Rev Gen*); Bochner (2003 *Nat Rev Gen*)
- microarray scan via 1 QTL interval mapping
 - Brem et al. (2002 *Science*); Schadt et al. (2003 *Nature*); Yvert et al. (2003 *Nat Gen*)
 - found putative *cis*- and *trans*- acting genes
- multivariate and multiple QTL approach
 - Lan et al. (2003 *Genetics*)

2. design issues for expensive phenotypes (thanks to CF “Amy” Jin)

- microarray analysis ~ \$1000 per mouse
 - can only afford to assay 60 of 108 in panel
 - wish to not lose much power to detect QTL
- selective phenotyping
 - genotype all individuals in panel
 - select subset for phenotyping
 - previous studies can provide guide

selective phenotyping

- emphasize additive effects in F2
 - F2 design: 1QQ:2Qq:1qq
 - best design for additive only: 1QQ:1Qq
 - drop heterozygotes (Qq)
 - reduce sample size by half with no power loss
- emphasize general effects in F2
 - best design: 1QQ:1Qq:1qq
 - drop half of heterozygotes (25% reduction)
- multiple loci
 - same idea but care is needed
 - drop 7/16 of sample for two unlinked loci

is this relevant to large QTL studies?

- why not phenotype entire mapping panel?
 - selectively phenotype subset of 50-67%
 - may capture most effects
 - with little loss of power
- two-stage selective phenotyping?
 - genotype & phenotype subset of 100-300
 - could selectively phenotype using whole genome
 - QTL map to identify key genomic regions
 - selectively phenotype subset using key regions

3. why are traits correlated?

- environmental correlation
 - non-genetic, controllable by design
 - historical correlation (learned behavior)
 - physiological correlation (same body)
- genetic correlation
 - pleiotropy
 - one gene, many functions
 - common biochemical pathway, splicing variants
 - close linkage
 - two tightly linked genes
 - genotypes Q are collinear

interplay of pleiotropy & correlation

pleiotropy only

correlation only

both

Korol et al. (2001)

fri 14 jul 2006

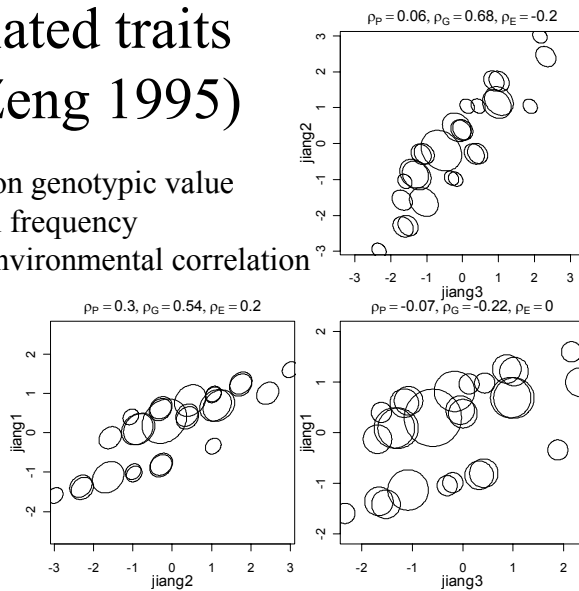

BTCI Yandell © 2006

27

3 correlated traits (Jiang Zeng 1995)

ellipses centered on genotypic value
width for nominal frequency
main axis angle environmental correlation
3 QTL, F2
27 genotypes

note signs of
genetic and
environmental
correlation

BTCI Yandell © 2006

28

pleiotropy or close linkage?

2 traits, 2 qtl/trait
 pleiotropy @ 54cM
 linkage @ 114,128cM
 Jiang Zeng (1995)

fri 14 jul 2006

FIGURE 2.—Two-dimensional log-likelihood surfaces (expressed as deviation from the maximum of the log-likelihoods on the diagonal) for the test of pleiotropy vs. close linkage are presented for two regions: the region between 45 and 75 cM of Figure 1 (A) and the region between 105 and 135 cM (B). X is the testing position for a QTL affecting trait 1 and Y is the testing position for a QTL affecting trait 2. On the diagonal of X-Y plane, two QTL are located in the same position and statistically are treated as one pleiotropic QTL. Z is the likelihood ratio test statistic scaled to zero at the maximum point of the diagonal.
