

Multiple Traits & Microarrays

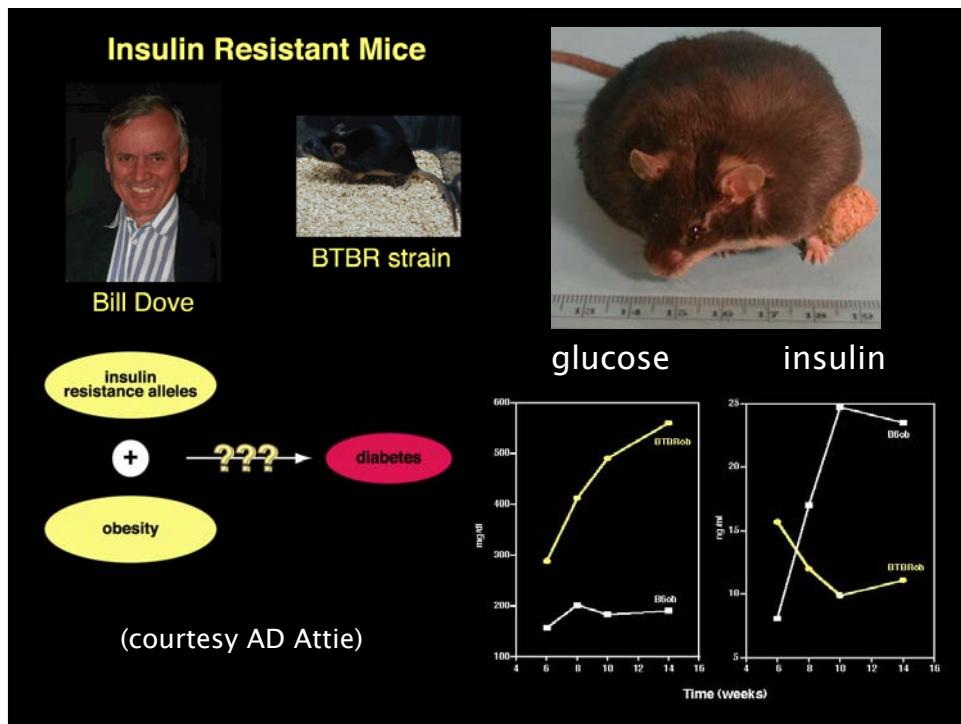

1. why study multiple traits together?	2-10
– diabetes case study	
2. design issues	11-13
– selective phenotyping	
3. why are traits correlated?	14-17
– close linkage or pleiotropy?	
4. modern high throughput	18-31
– principal components & discriminant analysis	
5. graphical models	32-36
– building causal biochemical networks	

1. why study multiple traits together?

- avoid reductionist approach to biology
 - address physiological/biochemical mechanisms
 - Schmalhausen (1942); Falconer (1952)
- separate close linkage from pleiotropy
 - 1 locus or 2 linked loci?
- identify epistatic interaction or canalization
 - influence of genetic background
- establish QTL x environment interactions
- decompose genetic correlation among traits
- increase power to detect QTL

Type 2 Diabetes Mellitus

studying diabetes in an F2

- segregating cross of inbred lines
 - B6.ob x BTBR.ob → F1 → F2
 - selected mice with ob/ob alleles at leptin gene (chr 6)
 - measured and mapped body weight, insulin, glucose at various ages (Stoehr et al. 2000 *Diabetes*)
 - sacrificed at 14 weeks, tissues preserved
- gene expression data
 - Affymetrix microarrays on parental strains, F1
 - (Nadler et al. 2000 *PNAS*; Ntambi et al. 2002 *PNAS*)
 - RT-PCR for a few mRNA on 108 F2 mice liver tissues
 - (Lan et al. 2003 *Diabetes*; Lan et al. 2003 *Genetics*)
 - Affymetrix microarrays on 60 F2 mice liver tissues
 - design (Jin et al. 2004 *Genetics* tent. accept)
 - analysis (work in prep.)

Traits NCSU QTL II: Yandell © 2005 6

why map gene expression as a quantitative trait?

- *cis*- or *trans*-action?
 - does gene control its own expression?
 - or is it influenced by one or more other genomic regions?
 - evidence for both modes (Brem et al. 2002 Science)
- simultaneously measure all mRNA in a tissue
 - ~5,000 mRNA active per cell on average
 - ~30,000 genes in genome
 - use genetic recombination as natural experiment
- mechanics of gene expression mapping
 - measure gene expression in intercross (F2) population
 - map expression as quantitative trait (QTL)
 - adjust for multiple testing

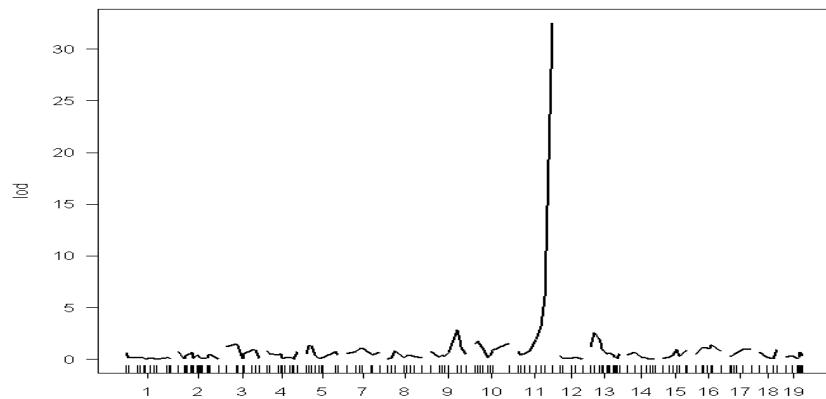

Traits

NCSU QTL II: Yandell © 2005

7

LOD map for PDI: *cis*-regulation (Lan et al. 2003)

Traits

NCSU QTL II: Yandell © 2005

8

mapping microarray data

- single gene expression as trait (single QTL)
 - Dumas et al. (2000 *J Hypertens*)
- overview, wish lists
 - Jansen, Nap (2001 *Trends Gen*); Cheung, Spielman (2002); Doerge (2002 *Nat Rev Gen*); Bochner (2003 *Nat Rev Gen*)
- microarray scan via 1 QTL interval mapping
 - Brem et al. (2002 *Science*); Schadt et al. (2003 *Nature*); Yvert et al. (2003 *Nat Gen*)
 - found putative *cis*- and *trans*- acting genes
- multivariate and multiple QTL approach
 - Lan et al. (2003 *Genetics*)

Traits

9

2. design issues for expensive phenotypes (thanks to CF “Amy” Jin)

- microarray analysis ~ \$1000 per mouse
 - can only afford to assay 60 of 108 in panel
 - wish to not lose much power to detect QTL
- selective phenotyping
 - genotype all individuals in panel
 - select subset for phenotyping
 - previous studies can provide guide

selective phenotyping

- emphasize additive effects in F2
 - F2 design: 1QQ:2Qq:1qq
 - best design for additive only: 1QQ:1Qq
 - drop heterozygotes (Qq)
 - reduce sample size by half with no power loss
- emphasize general effects in F2
 - best design: 1QQ:1Qq:1qq
 - drop half of heterozygotes (25% reduction)
- multiple loci
 - same idea but care is needed
 - drop 7/16 of sample for two unlinked loci

is this relevant to large QTL studies?

- why not phenotype entire mapping panel?
 - selectively phenotype subset of 50-67%
 - may capture most effects
 - with little loss of power
- two-stage selective phenotyping?
 - genotype & phenotype subset of 100-300
 - could selectively phenotype using whole genome
 - QTL map to identify key genomic regions
 - selectively phenotype subset using key regions

Traits

NCSU QTL II: Yandell © 2005

13

3. why are traits correlated?

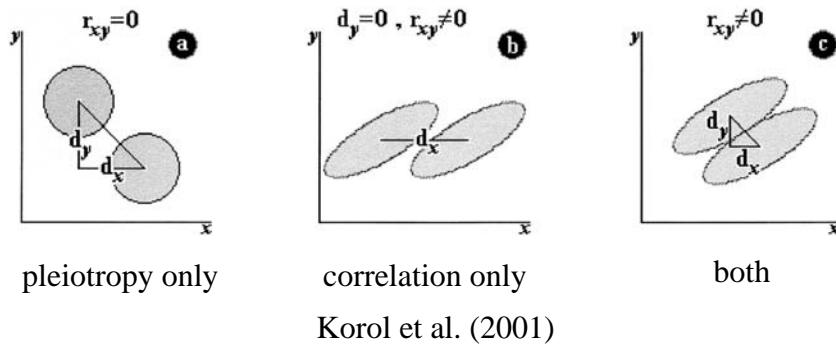

- environmental correlation
 - non-genetic, controllable by design
 - historical correlation (learned behavior)
 - physiological correlation (same body)
- genetic correlation
 - pleiotropy
 - one gene, many functions
 - common biochemical pathway, splicing variants
 - close linkage
 - two tightly linked genes
 - genotypes Q are collinear

Traits

NCSU QTL II: Yandell © 2005

14

interplay of pleiotropy & correlation

pleiotropy only correlation only both
Korol et al. (2001)

Traits

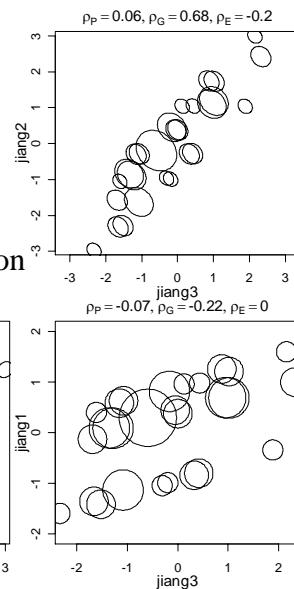

NCSU QTL II: Yandell © 2005

15

3 correlated traits (Jiang Zeng 1995)

ellipses centered on genotypic value
width for nominal frequency
main axis angle environmental correlation
3 QTL, F2
27 genotypes

note signs of
genetic and
environmental
correlation

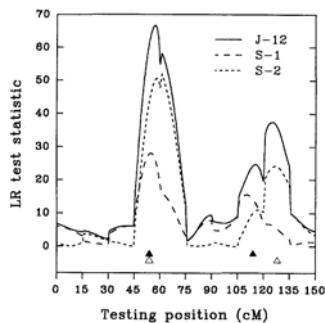

Traits

NCSU QTL II: Yandell © 2005

16

pleiotropy or close linkage?

2 traits, 2 qtl/trait
 pleiotropy @ 54cM
 linkage @ 114,128cM
 Jiang Zeng (1995)

Traits

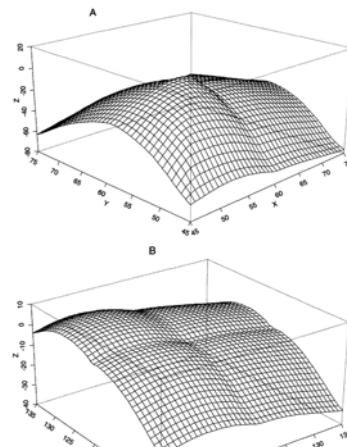

FIGURE 2.—Two-dimensional loglikelihood surfaces (extrema of the loglikelihoods on the diagonal) for the two traits. Two cases of linkage are presented for two regions: the region between 45 and 128 cM (A) and the region between 105 and 128 cM (B). A is the testing position of one QTL affecting trait 1 and Y is the testing position of another QTL affecting trait 2. On the diagonal of XY plane, two QTL are located in different chromosomes and are usually treated as one pleiotropic QTL. Z is the likelihood ratio test statistic scaled to zero at the maximum point of the diagonal.

NCSU QTL II: Yandell © 2005

17

4. modern high throughput biology

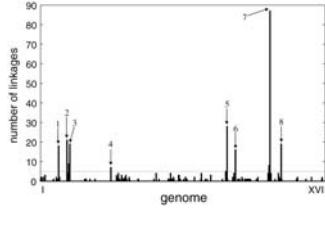

- measuring the molecular dogma of biology
 - DNA → RNA → protein → metabolites
 - measured one at a time only a few years ago
- massive array of measurements on whole systems (“omics”)
 - thousands measured per individual (experimental unit)
 - all (or most) components of system measured simultaneously
 - whole genome of DNA: genes, promoters, etc.
 - all expressed RNA in a tissue or cell
 - all proteins
 - all metabolites
- systems biology: focus on network interconnections
 - chains of behavior in ecological community
 - underlying biochemical pathways
- genetics as one experimental tool
 - perturb system by creating new experimental cross
 - each individual is a unique mosaic

19

finding heritable traits
(from Christina Kendziorski)

- reduce 30,000 traits to 300-3,000 heritable traits
- probability a trait is heritable

$$\text{pr}(H|Y, Q) = \text{pr}(Y|Q, H) \text{ pr}(H|Q) / \text{pr}(Y|Q)$$
 Bayes rule

$$\text{pr}(Y|Q) = \text{pr}(Y|Q, H) \text{ pr}(H|Q) + \text{pr}(Y|Q, \text{not } H) \text{ pr}(\text{not } H|Q)$$
- phenotype averaged over genotypic mean μ

$$\text{pr}(Y|Q, \text{not } H) = f_0(Y) = \int f(Y|G) \text{ pr}(G) dG$$
 if not H

$$\text{pr}(Y|Q, H) = f_1(Y|Q) = \prod_q f_0(Y_q)$$
 if heritable

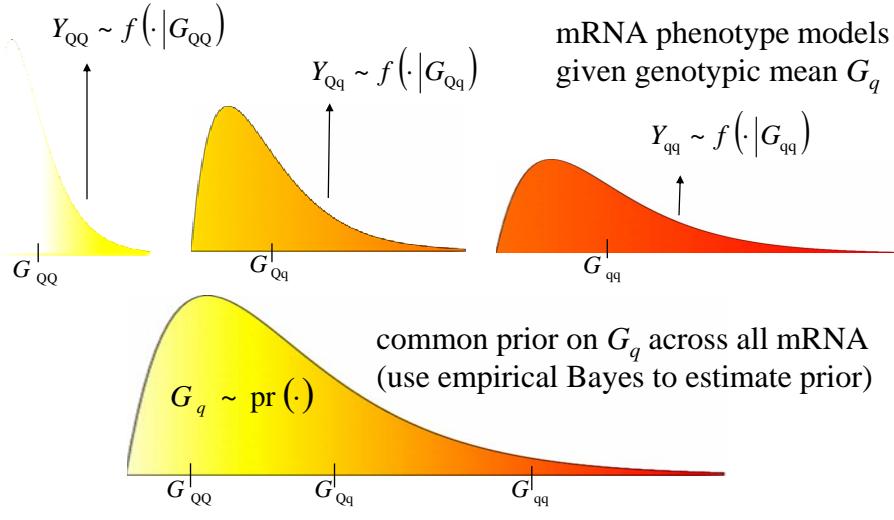

$$Y_q = \{Y_i \mid Q_i = q\}$$
 = trait values with genotype $Q=q$

Traits

20

hierarchical model for expression phenotypes (EB arrays: Christina Kendziorski)

21

expression meta-trait: pleiotropy

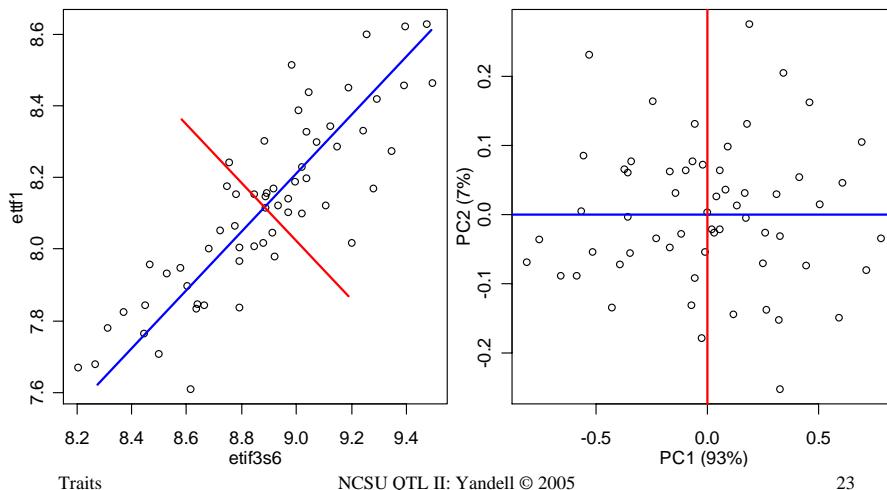

- reduce 3,000 heritable traits to 3 meta-trait(!)
- what are expression meta-trait?
 - pleiotropy: a few genes can affect many traits
 - transcription factors, regulators
 - weighted averages: $Z = YW$
 - principle components, discriminant analysis
- infer genetic architecture of meta-trait
 - model selection issues are subtle
 - missing data, non-linear search
 - what is the best criterion for model selection?
 - time consuming process
 - heavy computation load for many traits
 - subjective judgement on what is best

Traits

NCSU QTL II: Yandell © 2005

22

PC for two correlated mRNA

Traits

NCSU QTL II: Yandell © 2005

23

PC across microarray functional groups

Affy chips on 60 mice
~40,000 mRNA

2500+ mRNA show DE
(via EB arrays with
marker regression)

1500+ organized in
85 functional groups
2-35 mRNA / group

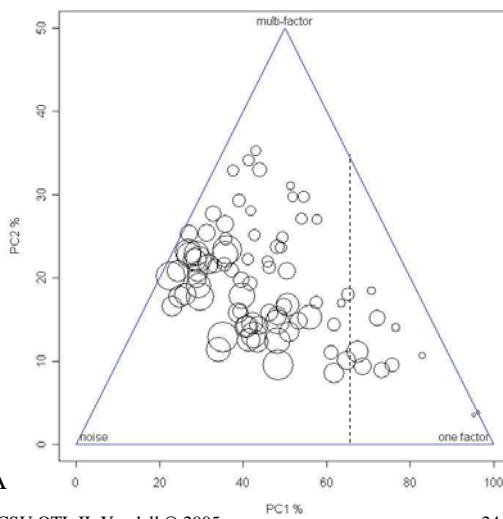

which are interesting?
examine PC1, PC2

circle size = # unique mRNA

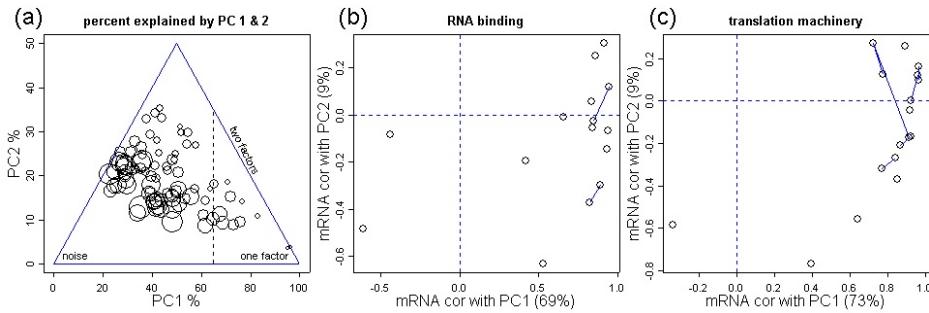

Traits

NCSU QTL II: Yandell © 2005

24

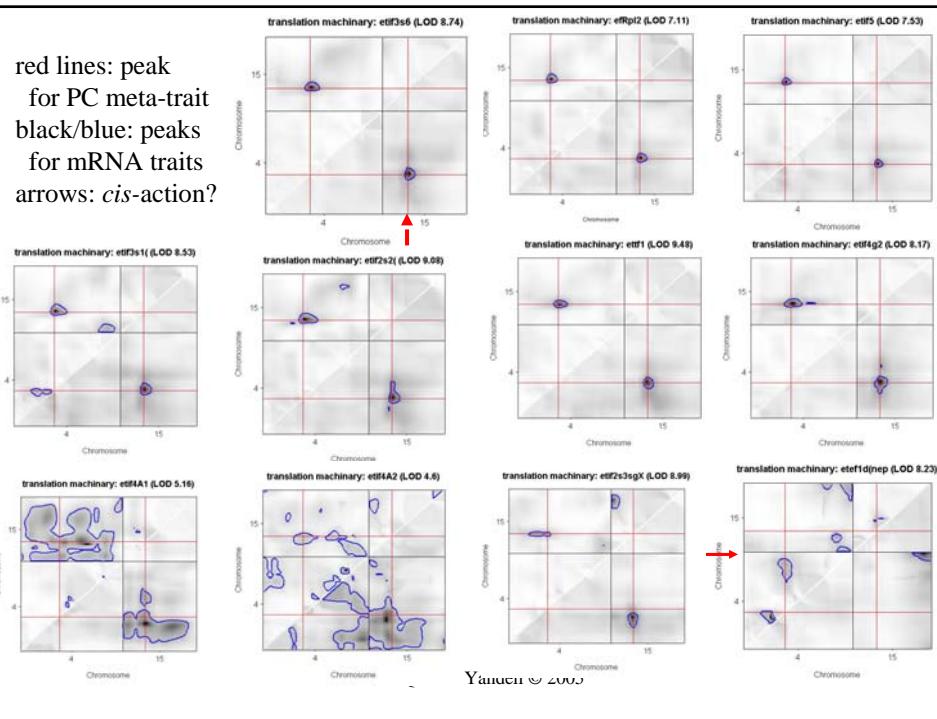

84 PC meta-trait by functional group focus on 2 interesting groups

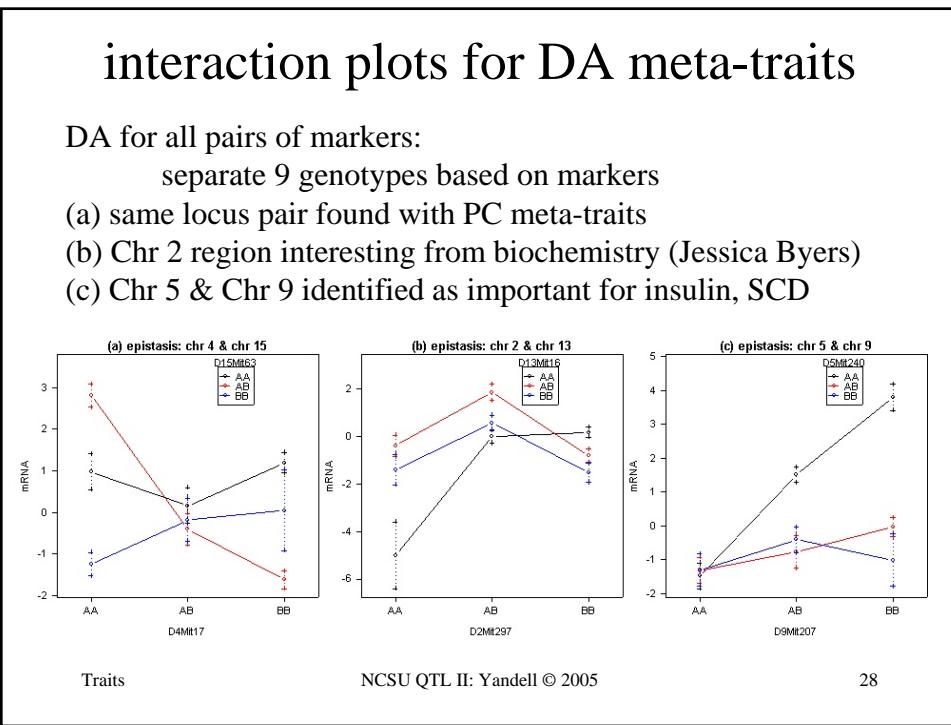

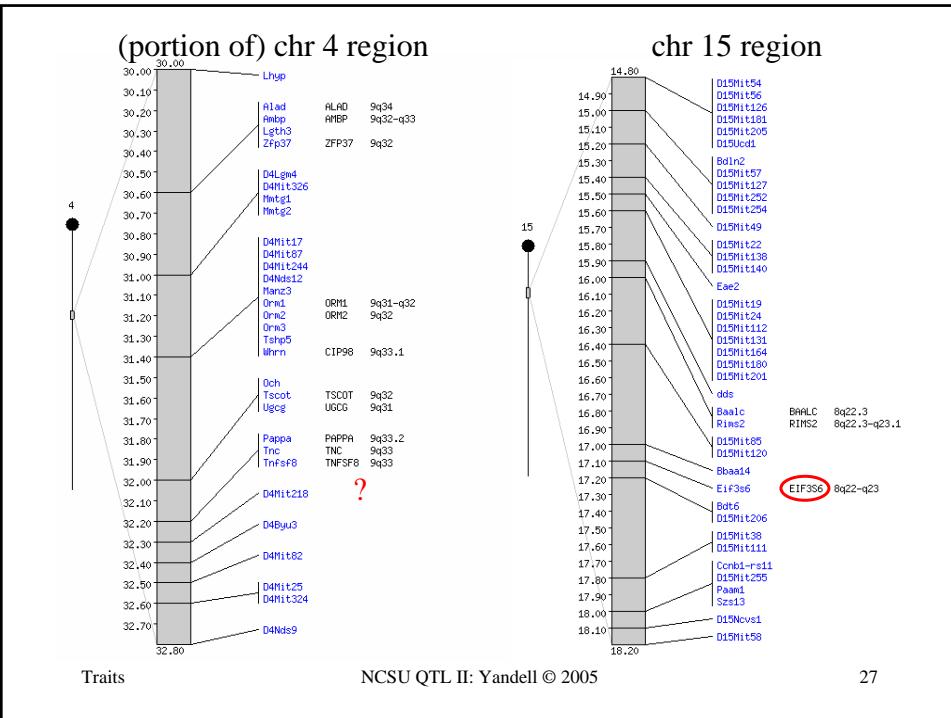

Traits

NCSU QTL II: Yandell © 2005

25

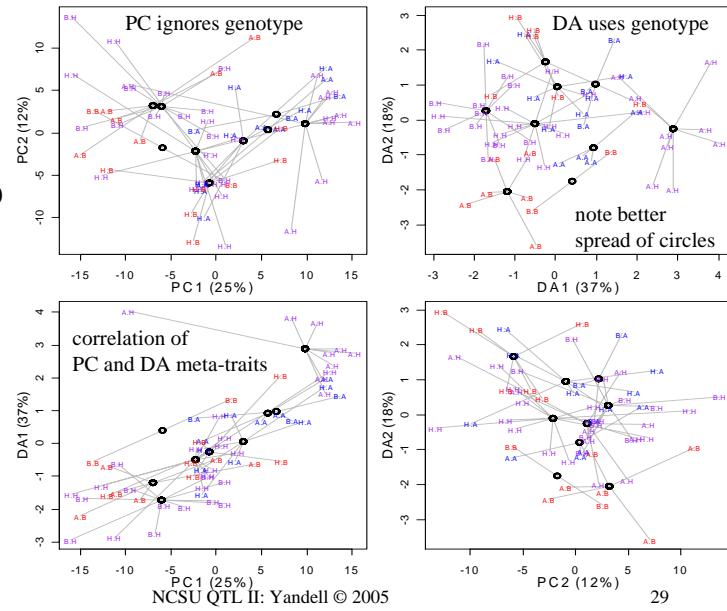

comparison of PC and DA meta-trait on 1500+ mRNA traits

genotypes from
Chr 4/Chr 15
locus pair
(circle=centroid)

PC captures
spread without
genotype

DA creates best
separation by
genotype

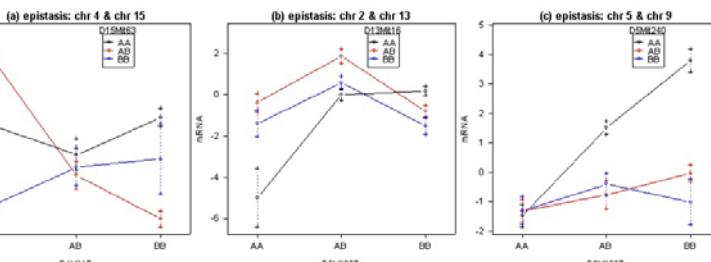

relating meta-trait to mRNA traits

DA meta-trait
standard units

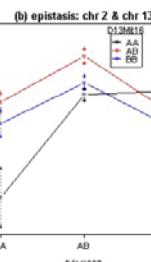

SCD trait
 \log_2 expression

Traits

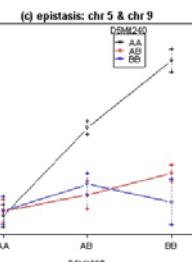

(a) epistasis: chr 4 & chr 15

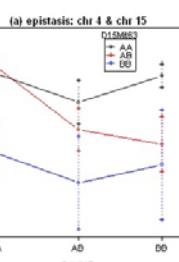

(b) epistasis: chr 2 & chr 13

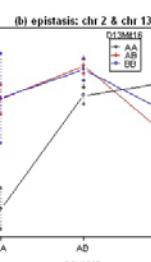

(c) epistasis: chr 5 & chr 9

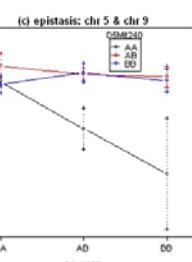

(a) epistasis: chr 4 & chr 15

(b) epistasis: chr 2 & chr 13

(c) epistasis: chr 5 & chr 9

30

DA: a cautionary tale

(184 mRNA with $|\text{cor}| > 0.5$; mouse 13 drives heritability)

building graphical models

- infer genetic architecture of meta-trait
 - $E(Z / Q, M) = \mu_q = \beta_0 + \sum_{\{q \text{ in } M\}} \beta_{qk}$
- find mRNA traits correlated with meta-trait
 - $Z \approx \underline{Y}W$ for modest number of traits \underline{Y}
- extend meta-trait genetic architecture
 - M = genetic architecture for \underline{Y}
 - expect subset of QTL to affect each mRNA
 - may be additional QTL for some mRNA

posterior for graphical models

- posterior for graph given multivariate trait & architecture

$$\text{pr}(G \mid \underline{Y}, Q, \underline{M}) = \text{pr}(\underline{Y} \mid Q, G) \text{pr}(G \mid \underline{M}) / \text{pr}(\underline{Y} \mid Q)$$

– $\text{pr}(G \mid \underline{M})$ = prior on valid graphs given architecture

- multivariate phenotype averaged over genotypic mean μ

$$\text{pr}(\underline{Y} \mid Q, G) = f_1(\underline{Y} \mid Q, G) = \prod_q f_0(Y_q \mid G)$$
$$f_0(Y_q \mid G) = \int f(Y_q \mid \underline{\mu}, G) \text{pr}(\underline{\mu}) d\underline{\mu}$$

- graphical model G implies correlation structure on \underline{Y}

- genotype mean prior assumed independent across traits

$$\text{pr}(\underline{\mu}) = \prod_t \text{pr}(\mu_t)$$

Traits

NCSU QTL II: Yandell © 2005

33

from graphical models to pathways

- build graphical models

QTL → RNA1 → RNA2

– class of possible models

– best model = putative biochemical pathway

- parallel biochemical investigation

– candidate genes in QTL regions

– laboratory experiments on pathway components

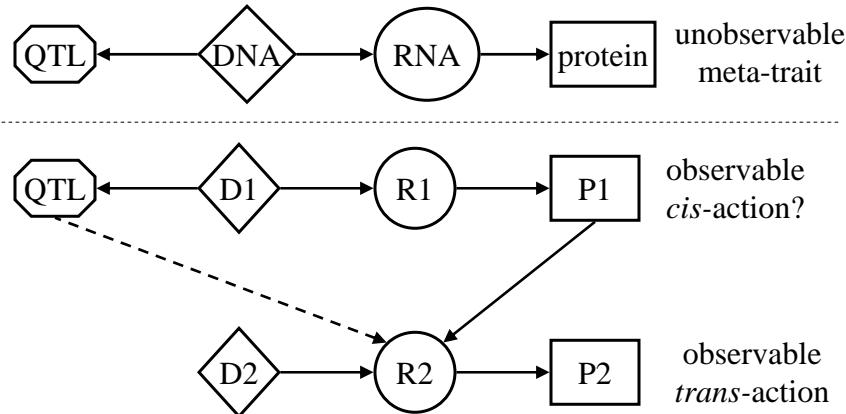

Traits

NCSU QTL II: Yandell © 2005

34

graphical models (with Elias Chaibub)

$$f_1(\underline{Y} / Q, G=g) = f_1(Y_1 / Q) f_1(Y_2 / Q, Y_1)$$

Traits

NCSU QTL II: Yandell © 2005

35

summary

- expression QTL are complicated
 - need to consider multiple interacting QTL
- coherent approach for high-throughput traits
 - identify heritable traits
 - dimension reduction to meta-trait
 - mapping genetic architecture
 - extension via graphical models to networks
- many open questions
 - model selection
 - computation efficiency
 - inference on graphical models
